#### **ABSTRACT**

An air conditioning unit supplies air conditioned air into a center connection duct within a center console and then into ducting within a front seat of a vehicle. Within the front seat, a U-shaped flexible duct member allows the ducting to bend with travel of the front seat. A top blow-out port at a top back surface of a back-support portion of the front seat supplies conditioned air from the ducting to a seated rear passenger and the vehicle cabin. A bellows duct portion located at a boundary between a seat portion and the back-support portion of the front seat permits the back-support portion to fold forward.
